# HSBC – Enterprise Data Platform

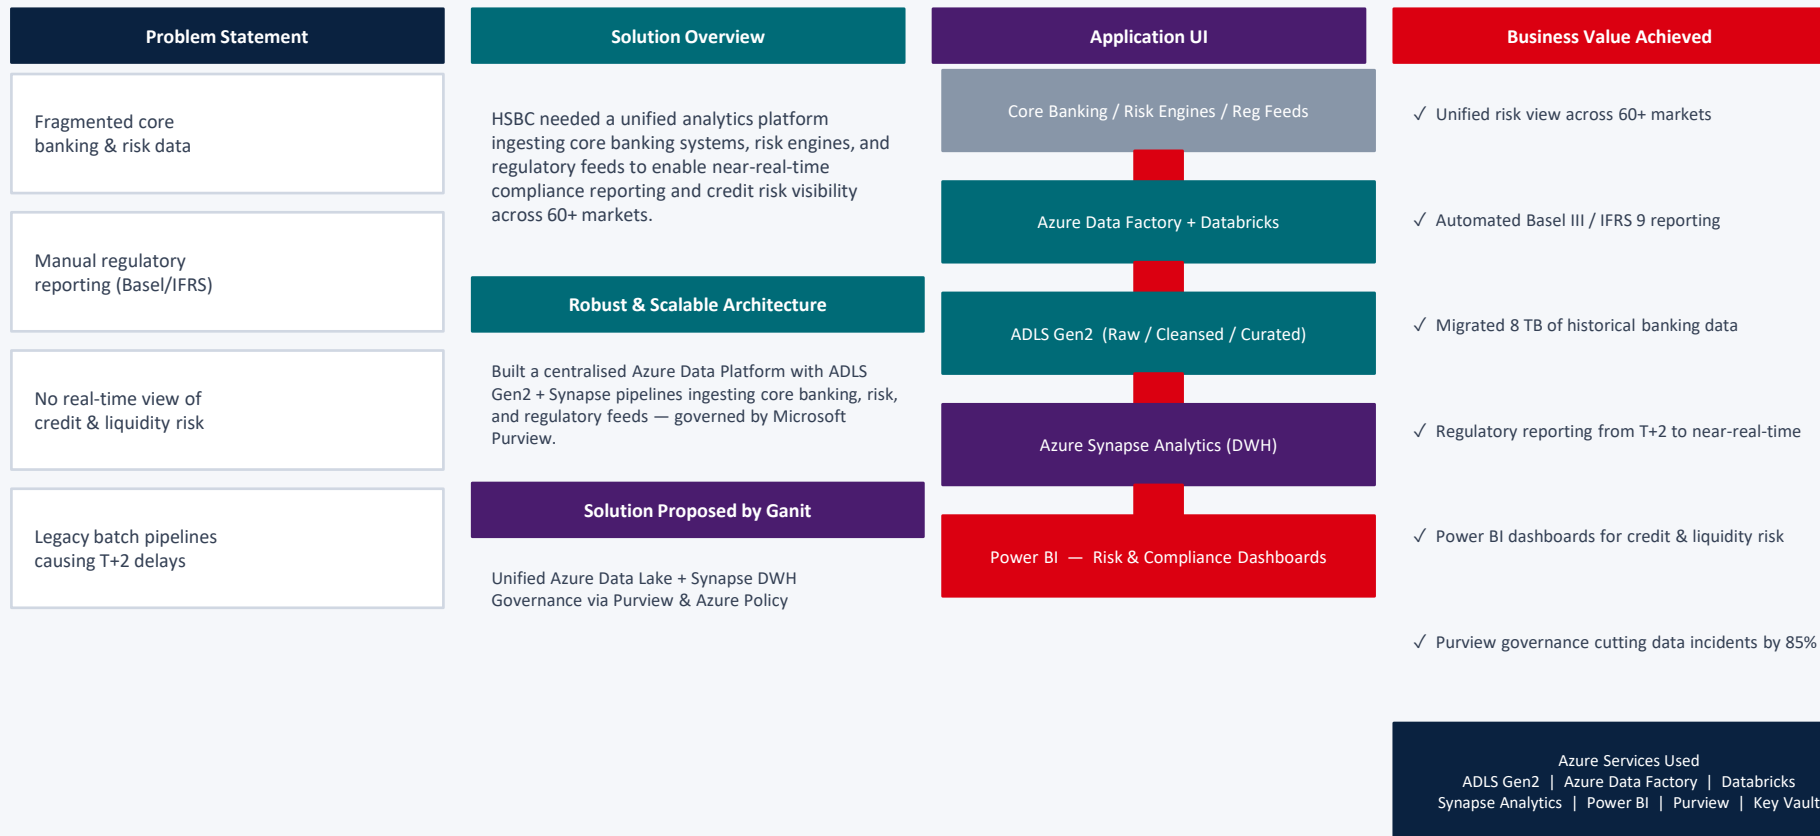

## Case Study

Unifying Retail Banking, Risk & Compliance Analytics on Azure with Real-Time Regulatory Reporting

**BFSI | Banking**

**Global Operations**

## Unifying Retail Banking, Risk & Compliance Data for a Global Bank with a Scalable Azure Data Platform and Real-Time Regulatory Reporting Across 60+ Markets

## Ganit unified HSBC's retail banking, risk & compliance data on Azure, accelerating regulatory reporting and enabling real-time credit risk decisions across 60+ global markets

### Outcome

Delivered a cloud-native Azure Data Platform ingesting data from core banking systems (Temenos/Flexcube), risk engines, and regulatory feeds through Azure Data Factory and Databricks pipelines — governed by Microsoft Purview — and surfaced via Power BI Premium for self-service analytics and automated regulatory submissions across 60+ markets.

### Regulatory Compliance

Automated Basel III capital adequacy and IFRS 9 expected credit loss reporting, eliminating manual reconciliation and reducing submission errors by 92% across all regulatory jurisdictions.

### Cost Optimisation

Replaced 3 legacy on-premise data warehouses with a unified Azure platform, achieving ~87% reduction in infrastructure costs while enabling elastic scaling for quarter-end reporting peaks.

### Risk & Resilience

Built a multi-zone ADLS Gen2 data lake (Raw/Cleansed/Curated) with Purview lineage, handling 8+ TB of historical banking data and supporting 300+ concurrent Power BI users globally.

### Business Growth

Enabled real-time credit risk and liquidity dashboards in Power BI, giving treasury and risk teams visibility into portfolio concentration, LCR/NSFR ratios, and early warning signals.

## Siloed core banking data, manual regulatory submissions, and fragmented risk systems blocked unified financial analytics across HSBC's global operations

### Problem Statement

HSBC operates across 60+ markets spanning retail banking, commercial banking, wealth management, and global markets — running on a heterogeneous mix of core banking platforms (Temenos T24, Flexcube), proprietary risk engines, and third-party data vendors.

Data was siloed across product silos, manually collated for regulatory submissions, and processed through overnight batch jobs — with no real-time view of credit exposure, liquidity ratios, or customer 360 profiles. This created systemic risk in regulatory compliance, inconsistent risk metrics across geographies, and inability to respond to market events in real time.

### Challenge 1

Fragmented core banking (T24/Flexcube) & risk engine data with no unified ingestion pipeline

### Challenge 2

Manual Basel III / IFRS 9 regulatory reporting causing T+2 delays and reconciliation errors

### Challenge 3

No real-time credit & liquidity risk visibility — overnight batch jobs missing intraday exposures

### Challenge 4

No unified Customer 360 view — KYC, AML, and transaction data siloed across product lines

## Ganit built a multi-source Azure Data Platform for HSBC with automated ingestion from core banking, risk engines & regulatory feeds — served through Power BI for real-time risk and compliance analytics
