IKEA – GCP Data Warehouse & Tableau BI Platform

Case Study

Unifying Sales, Store Operations & Supply Chain Analytics on GCP — Enabling Real-Time Cross-Functional Decisions Across IKEA's Stores, Channels & Fulfilment Network

460+ Stores | 60+ Markets

Building a Unified Retail Data Warehouse on GCP and Self-Serve Tableau BI Platform for IKEA — Enabling Real-Time Sales, Store Operations & Supply Chain Analytics Across 460+ Stores and 60+ Markets

Ganit unified IKEA's in-store, e-commerce & ERP data on GCP, delivering 65 Tableau dashboards that transformed manual reporting into real-time cross-functional intelligence across stores, channels & supply chain

Outcome

Delivered a cloud-native GCP data warehouse ingesting POS in-store, SAP ERP, e-commerce, and click-and-collect data through automated Cloud Dataflow ETL pipelines into a unified BigQuery DWH — governed with CDC pipelines, DQ checks, and custom calendar logic — surfaced via Tableau Server for 20 business teams with 65 dashboards covering 1,600+ KPIs across sales, category, store ops, SCM, PnL, and customer analytics.

Operational Efficiency

Eliminated 3-day manual Excel consolidation by automating multi-channel ingestion via GCP Dataflow — reducing reporting latency from 3 days to sub-15-second BigQuery dashboard refresh across all 460+ stores and markets.

Cost Optimisation

GCS file partitioning and BigQuery slot optimisation reduced storage and compute costs by 55%. Single published Tableau extracts power multiple dashboards — removing redundant scheduled extracts and pipeline duplication.

Scalability & Reliability

Built a three-zone GCS data lake (Raw / Cleansed / Curated) handling 900+ SFTP files per month, 6 API connections, 7 source systems, and 32 CDC pipelines — with automated DQ checks and Dataplex data governance.

Business Growth

65 Tableau dashboards covering Sales, Category, SCM, PnL, Marketing, Store Ops and Customer Analytics gave 20 business teams a single source of truth — improving target achievement compliance by 28% and operational productivity by 15–18%.

Siloed POS, SAP ERP & e-commerce data, inconsistent KPIs across teams, and manual Excel-based reporting blocked unified retail analytics across IKEA's global store network and supply chain

Problem Statement

IKEA operates 460+ stores across 60+ markets — spanning physical in-store retail, e-commerce, click-and-collect, and institutional sales channels — running on a heterogeneous mix of POS systems, SAP ERP, and third-party e-commerce platforms.

Sales, inventory, and supply chain data was fragmented across independent systems with each business function maintaining separate Excel files for the same KPIs, resulting in conflicting numbers and 3-day reporting delays. Teams had no ability to analyse performance simultaneously across Product, Location, Channel, and Fulfilment hierarchies. Manual processes consumed 30+ person-hours daily with no mechanism for consistent target tracking, working-day-based time comparisons, or automated data quality assurance across markets.

Challenge 1

POS in-store, SAP ERP, e-commerce & click-and-collect data siloed — no unified ingestion, reconciliation, or cross-channel analytics pipeline

Challenge 2

Each business team had different numbers for the same KPIs — no single source of truth across Sales, Units, ABV, GM%, Availability, and Fill Rate

Challenge 3

Custom time-period comparisons (trading-day-based, not date-based) not available — blocking accurate week-on-week and period-over-period analysis

Challenge 4

Store & product master not standardised across markets — Location and Article hierarchies inconsistent, causing misaligned reporting across countries

Ganit built a multi-source GCP data warehouse for IKEA with automated Dataflow ETL pipelines, CDC ingestion & a 65-dashboard Tableau Server platform for real-time retail analytics across stores, channels & supply chain
