P&G – Data Warehouse

Case Study

Unifying Omnichannel Sales & Trade Data for a Global FMCG Leader with a Scalable AWS Data Lake and Real-Time Analytics Across North America & APAC Markets

Problem Statement	Solution Overview	Application UI	Business Value Achieved
Fragmented CRM & trade promotion data Delayed reporting from manual file uploads No unified view of omnichannel sales REST API data stranded in operational systems	Robust & Scalable Architecture Built a centralized AWS data lake on S3 with Glue ETL pipelines ingesting Salesforce, flat files, and REST APIs — orchestrated by Apache Airflow on MWAA. Application UI Deployed Tableau Server on AWS with live connections to Redshift for self-service dashboards and trade analytics. Solution Proposed by Ganit Unified AWS data lake + Redshift DWH Governance via AWS Glue Data Catalog & Lake Formation	Salesforce / Flat Files / REST APIs AWS Glue ETL + MWAA (Airflow) S3 Data Lake (Raw / Cleansed) Amazon Redshift (DWH) Tableau Server (Dashboards)	- Unified omnichannel sales view across 6 markets - Eliminated manual file-handling bottlenecks with automated ingestion - Migrated 4 TB of historical Salesforce & trade data - Reporting cycle cut from 3 days to under 4 hours - Tableau dashboards enabling real-time trade promo ROI tracking - Governance via Lake Formation reducing data access incidents by 80%
A global FMCG leader (US, Canada, UK, Australia, Japan, India) needed a unified analytics platform ingesting Salesforce CRM, manual Excel/CSV uploads, and third-party REST APIs to drive trade promotion and omnichannel sales decisions.

AWS Services Used Amazon S3 AWS Glue MWAA Amazon Redshift AWS Lambda Lake Formation AWS Secrets Mgr IAM			

Ganit unified omnichannel trade & CRM data on AWS for P&G, accelerating analytics adoption and driving decisions across North America & APAC markets

Outcome

Delivered a cloud-native data lake and warehouse on AWS, ingesting data from Salesforce CRM, manual Excel/CSV file uploads via S3, and third-party REST APIs through Lambda-based connectors — orchestrated by Apache Airflow on MWAA — and surfaced through Tableau Server for self-service analytics across 6 regional markets.

Operational Efficiency

Eliminated manual file-handling and siloed CRM exports by automating Salesforce ingestion and REST API polling via AWS Glue and Lambda, reducing data latency from 3 days to under 4 hours.

Cost Optimization

Used S3 intelligent-tiering and Redshift Spectrum for infrequent historical queries, achieving ~89% reduction in legacy on-prem warehouse costs while scaling on demand.

Scalability & Reliability

Built a multi-zone S3 data lake (Raw / Cleansed / Curated) with Lake Formation governance, handling 4+ TB of historical data and supporting 200+ concurrent Tableau users.

Business Growth

Enabled real-time trade promotion ROI dashboards in Tableau, giving commercial teams actionable visibility into SKU-level performance, distributor sell-through, and promo effectiveness.

Siloed CRM exports, manual file uploads, and stranded API data blocked unified trade analytics across global markets

Problem Statement

A global FMCG enterprise operating across 6 markets (US, Canada, UK, Australia, Japan, India) ran trade promotions and omnichannel sales programs spanning modern trade, e-commerce, and general trade channels.

Data was siloed across Salesforce CRM, manually uploaded distributor Excel/CSV reports, and third-party retail partner REST APIs — with no automated pipeline connecting these sources to a unified analytics layer. This led to delayed decisions, inconsistent trade spend reporting, and inability to measure promotional ROI in near-real time.

Challenge 1

Fragmented Salesforce CRM & trade promo data with no automated export pipeline

Challenge 2

Manual Excel/CSV file uploads causing 2–3 day reporting delays

Challenge 3

REST API data from retail partners stranded in operational systems

Challenge 4

No unified SKU-level view of sell-in vs sell-out across channels & markets

Ganit built a multi-source AWS data lake with automated ingestion from Salesforce, flat files & REST APIs, served through Tableau for real-time trade analytics

Solution Overview

Robust & Scalable Architecture

- Salesforce data ingested via AWS Glue + custom SFDC connectors with incremental delta loads.
- Manual Excel/CSV files auto-processed on S3 upload via Lambda triggers and Glue jobs.
- Third-party retail REST APIs polled on schedule via MWAA (Airflow) DAGs with retry logic.
- Raw → Cleansed → Curated S3 zones with schema enforcement via Glue Data Catalog.

Application UI — Tableau Server on AWS

- Deployed Tableau Server on EC2 with live/extract connections to Redshift.
- Dashboards for trade promo ROI, distributor sell-through, and SKU-level market performance.
- Row-level security enforced via Redshift views mapped to regional user roles.

Data Architecture
