

# **Data Engineering Case Studies**

Siemens Healthineers

25 May 2026

Siemens Healthineers required a unified data platform to integrate multiple enterprise systems, enabling automated ingestion, transformation, and stakeholder-specific analytics at scale.

Problem statement & challenges

Siemens Healthineers managed critical operational and sales data across **Salesforce, Odoo ERP, SharePoint**, and multiple **RDS databases** hosted on AWS and EC2. However, the absence of a unified data platform led to **manual data pulls, repetitive calculations**, and **limited analytical visibility** across departments.

Siemens Healthineers faced several challenges:

- No centralized pipeline to synchronize data from Salesforce, Odoo, and SharePoint into a single database.
- Manual and repetitive data extraction processes, increasing effort and risk of inconsistency.
- Lack of standardized master and transactional data models, leading to non-uniform reporting across teams.
- Difficulty meeting stakeholder-specific reporting needs requiring more manual work.

Solution Proposed by Ganit

- Build a cloud-based data integration and automated data pipelines to facilitate data ingestion on AWS RDS.
- Reusable data models to facilitate data transformation and accelerate analytics.

Solution Overview

Robust & scalable architecture

Designed and implemented a **multi-source data integration platform** on AWS RDS to automate the ingestion, transformation. The layered architecture ensures scalability, consistency, and secure data handling across systems.

Automated Data Modeling & Refresh

Developed **stored procedures** to create and refresh master and fact tables. All transformations, dependencies, and refresh schedules were fully automated within AWS, ensuring accurate and timely data availability for analysis.

Business Value Achieved

- Established a **unified and automated data platform** integrating Salesforce, Odoo, SharePoint, and EC2-hosted RDS databases into a single AWS RDS environment.
- Achieved **end-to-end automation** of data refresh cycles through stored procedures, eliminating manual intervention and reducing processing time by over **80%**.
- Built **standardized master and fact tables** aligned to stakeholder requirements, ensuring consistent, accurate, and reusable analytics outputs.
- Enabled **seamless data consumption** by external BI vendors for dashboarding, empowering real-time, data-driven decision-making across business units.

# Ganit delivered a scalable AWS-based data platform that unified enterprise systems and automated analytics for faster decision-making

## Outcome

Delivered a **cloud-native multi-source data platform** integrating Salesforce, Odoo, SharePoint, and multiple RDS sources into AWS RDS — enabling **automated data ingestion, transformation, and stakeholder-specific analytics** across business units.

### Operational Efficiency

Streamlined the entire data pipeline across diverse sources, removing manual dependencies and establishing a centralized, data repository to ensure consistency, accuracy, and a single source of truth.

### Cross-Functional Accessibility

Empowered business and analytics teams with **ready-to-use, stakeholder-specific views**, streamlining collaboration and accelerating data-driven decisions across departments.

### Scalability & Reliability

Built a scalable framework capable of handling growing data volumes from multiple sources, with automated scheduling, monitoring, and error handling through CloudWatch.

### Automation & Efficiency

Achieved **95% automation** across data refresh and complex calculation workflows, drastically reducing manual effort and turnaround time for multiple business stakeholders..

# Lack of centralized data and automation caused manual workload, dependency, and reporting inconsistencies

## Problem Statement

- Siemens Healthineers needed a unified data platform to integrate information from Salesforce, Odoo ERP, SharePoint, and multiple RDS servers into a centralized repository on AWS.
- The absence of automated data pipelines led to manual intervention, lot of manual extraction and excel work which resulted in inconsistent reporting across business functions.

Data from **Salesforce, Odoo, and SharePoint** existed in isolation, causing **fragmented insights** and **redundant data handling**.

Lack of automation and synchronization led to **slow data availability**, delaying **critical business insights** and **stakeholder decisions**.

High **manual involvement** in data extraction, transformation, led to **inconsistencies** and **dependency on individual teams**.

Absence of **standardized data models** caused **reporting mismatches** and rework across departments.

# We built an automated, scalable AWS-based data platform to unify enterprise data and enable analytics at scale

## Solution Overview

### Automated Data Orchestration

Established **end-to-end automated pipelines** for ingestion, transformation, and refresh, leveraging **stored procedures and scheduled workflows** to ensure timely, accurate data availability with minimal manual intervention..

### Standardized & Reusable Data Models

Developed **master and analytical data models** — including facts, dimensions, and standardized views — enabling **reusable structures** for stakeholder-specific analytics and reporting.

### Unified Data Platform

Implemented a **robust, scalable data ecosystem** on AWS to seamlessly ingest and process data from **multiple enterprise sources** into a centralized repository for consistent, organization-wide access.

### Analytics Ready Foundation

Created a **future-ready data foundation** for **self-service BI, performance tracking, and executive dashboards**, empowering business teams with faster insights and data-driven decision-making.

## Data Architecture
