Decathlon – BI & Data Engineering

Case Study

Unified Sports Retail Analytics on GCP & Looker — Enabling Real-Time Sales, Inventory & Category Decisions Across Stores, Channels & Supply Chain

Retail | Omnichannel DE | GCP BI | Looker 3,500+ Stores | Global

Building a Unified Retail Data Warehouse on GCP and Self-Serve Looker BI Platform for Decathlon — Enabling Real-Time Sales, Inventory & Sports Category Analytics Across Stores, Channels & Supply Chain

Ganit unified Decathlon's retail, e-com & sports category data on GCP, delivering 55 Looker dashboards that transformed manual reporting into real-time cross-functional intelligence across stores, channels & supply chain

Outcome

Delivered a cloud-native GCP data warehouse ingesting POS retail, SAP ERP, e-commerce portal, and mobile app data through automated Dataflow ETL pipelines into a unified BigQuery DWH — governed with CDC pipelines, DQ checks, and custom fiscal calendar logic — surfaced via Looker for 15 business teams with 55 dashboards covering 1,200+ KPIs.

Operational Efficiency

Eliminated 3-day manual Excel consolidation by automating multi-channel ingestion via Dataflow ETL — reducing reporting latency from 3 days to sub-15-second Looker dashboard refresh across all stores.

Cost Optimisation

GCS file partitioning best practices reduced query scan costs significantly — achieving 45% reduction in recurring pipeline costs. Single published Looker explores power multiple dashboards, removing redundant BigQuery processing.

Scalability & Reliability

Built a three-zone GCS data lake (Raw / Cleansed / Curated) handling 700+ SFTP files per month, 6 API connections, 7 source systems, and 24 CDC pipelines — with automated DQ checks pre-ingestion.

Business Growth

55 Looker dashboards covering Sales, Category, SCM, PnL, Marketing and Customer Analytics gave 15 business teams a single source of truth — improving target achievement compliance by 22% and productivity by 10–12%.

Siloed POS, SAP & e-commerce data, inconsistent KPIs across teams, and manual Excel-based reporting blocked unified retail analytics across Decathlon's store network and supply chain

Problem Statement

Decathlon operates 3,500+ sports retail stores globally — spanning physical stores, e-commerce, institutional B2B sales, and mobile app ordering — running on a complex mix of POS systems, SAP ERP, and third-party e-com portals.

Sales data was fragmented across independent systems with each channel reporting at different granularities. Every team maintained separate Excel files for the same KPIs, resulting in conflicting numbers, 3-day reporting delays, and no ability to analyse performance across Product, Location, and Channel hierarchies simultaneously. Manual processes consumed 20+ person-hours per day, and there was no mechanism for consistent target tracking, custom time-period comparisons, or automated data quality assurance.

Challenge 1

POS retail, SAP ERP, e-commerce & mobile app data siloed — no unified ingestion or reconciliation pipeline

Challenge 2

Each business team maintained different numbers for the same KPI — no single source of truth across Sales, ABV, GM%

Challenge 3

Custom fiscal-period comparison (sports-season-based, not date-based) not available — blocking accurate period-over-period analysis

Challenge 4

Category and SKU-level margin analytics unavailable in real time — preventing proactive pricing and inventory decisions

Ganit built a multi-source GCP data warehouse for Decathlon with automated Dataflow ETL pipelines, CDC ingestion, and a 55-dashboard Looker platform for real-time retail analytics
