500+ Outlets | Global

Unifying Multi-Channel Customer Feedback for a Global QSR Leader with a Scalable AI/NLP VoC Platform and Real-Time Sentiment Intelligence Across 500+ Pizza Hut Outlets

Ganit unified Pizza Hut's multi-channel customer feedback with an AI/NLP VoC platform, transforming fragmented reviews into real-time brand intelligence across 500+ outlets

Outcome

Delivered a cloud-native AI/NLP VoC platform scraping customer reviews from Google, Zomato, Swiggy, Twitter/X, and in-store channels — processed through deep learning sentiment models customised for QSR food vocabulary — and surfaced through Power BI for real-time brand intelligence, store-level NPS tracking, and automated negative review alerts across all Pizza Hut outlets.

Operational Efficiency

Eliminated 30 hrs/day of manual review monitoring by automating scraping and NLP classification across 10+ platforms — reducing daily brand monitoring to under 30 minutes.

Customer Recovery

Automated negative review alerts with <15 min response SLA enabled proactive outreach — winning back 25%+ dissatisfied customers and significantly improving repeat visit rates.

Brand Intelligence

Built a store-level NPS and sentiment scoring engine covering Food, Service, Ambience, and Value — enabling regional managers to identify and fix underperforming outlets before issues escalate.

Business Growth

Competitor benchmarking module revealed same-city sentiment gaps — enabling targeted marketing campaigns and menu adjustments that improved Pizza Hut's relative sentiment score by 18% in 6 months.

Scattered customer reviews, manual brand monitoring, and siloed feedback channels blocked real-time sentiment intelligence across Pizza Hut's outlet network

Problem Statement

Pizza Hut operates 500+ outlets across India and global markets — generating thousands of daily customer reviews across Google, Zomato, Swiggy, Twitter/X, Instagram, and in-store feedback cards.

Customer feedback was unstructured and siloed across platforms — monitored manually by brand teams spending 30+ person-hours per day. Sentiment analysis was surface-level, not actionable at store or category level. There was no mechanism to detect negative review spikes, benchmark against competitors, or quantify customer pain points by business function (food quality, service, delivery, value). Brand damage often went undetected until it had already spread.

Challenge 1

Unstructured feedback scattered across 10+ platforms — no unified ingestion or monitoring pipeline

Challenge 2

Sentiment analysis was uber-level only — not actionable by store, city, food category, or service type

Challenge 3

No real-time negative review detection — brand damage spread before teams could respond

Challenge 4

No competitor benchmarking — Pizza Hut had no visibility into relative brand health vs. Domino's / KFC in same markets

Ganit built a multi-source AI/NLP VoC platform for Pizza Hut with automated scraping from 10+ channels, deep learning sentiment models, and Power BI dashboards for real-time brand intelligence
