Jaguar – Microsoft Fabric

Case Study

Transforming Sales & Distribution Analytics with a Scalable Microsoft Fabric Platform

One pager

Modernizing Sales & Distribution Analytics for a Leading Automotive Brand with Microsoft Fabric – Enabling Real-Time Dashboards Across Sales, SFA & DMS

Three pager

Ganit unified Jaguar's sales, SFA & distribution data on Microsoft Fabric, accelerating analytics adoption and driving decisions across all regional markets

Outcome

Delivered a cloud-native Lakehouse and warehouse on Microsoft Fabric, ingesting data from SFA mobile apps, manual Excel/CSV file uploads, and third-party DMS REST APIs through automated Fabric Pipelines — and surfaced through Power BI for self-service analytics across all regional markets.

Operational Efficiency

Eliminated manual file-handling and siloed SFA exports by automating ingestion via Fabric Pipelines and Dataflows, reducing data latency from 2 days to under 4 hours.

Cost Optimization

Used OneLake intelligent tiering and Fabric Warehouse for infrequent historical queries, achieving ~85% reduction in legacy on-prem warehouse costs while scaling on demand.

Scalability & Reliability

Built a multi-zone OneLake (Bronze / Silver / Gold) with Purview governance, handling 3+ TB of historical data and supporting 150+ concurrent Power BI users.

Business Growth

Enabled real-time dealer performance and trade ROI dashboards in Power BI, giving sales teams actionable visibility into SKU-level performance and distributor sell-through.

Siloed SFA data, manual file uploads, and stranded DMS API data blocked unified sales analytics across regional markets

Problem Statement

A leading automotive brand operating across multiple regions ran sales programs spanning primary sales, secondary/SFA, and DMS channels.

Data was siloed across SFA mobile apps, manually uploaded distributor Excel/CSV reports, and third-party dealer REST APIs — with no automated pipeline connecting these sources to a unified analytics layer. This led to delayed decisions, inconsistent trade spend reporting, and inability to measure dealer ROI in near-real time.

Challenge 1

Fragmented SFA mobile & distributor data with no automated export pipeline

Challenge 2

Manual Excel/CSV file uploads causing 2–3 day reporting delays

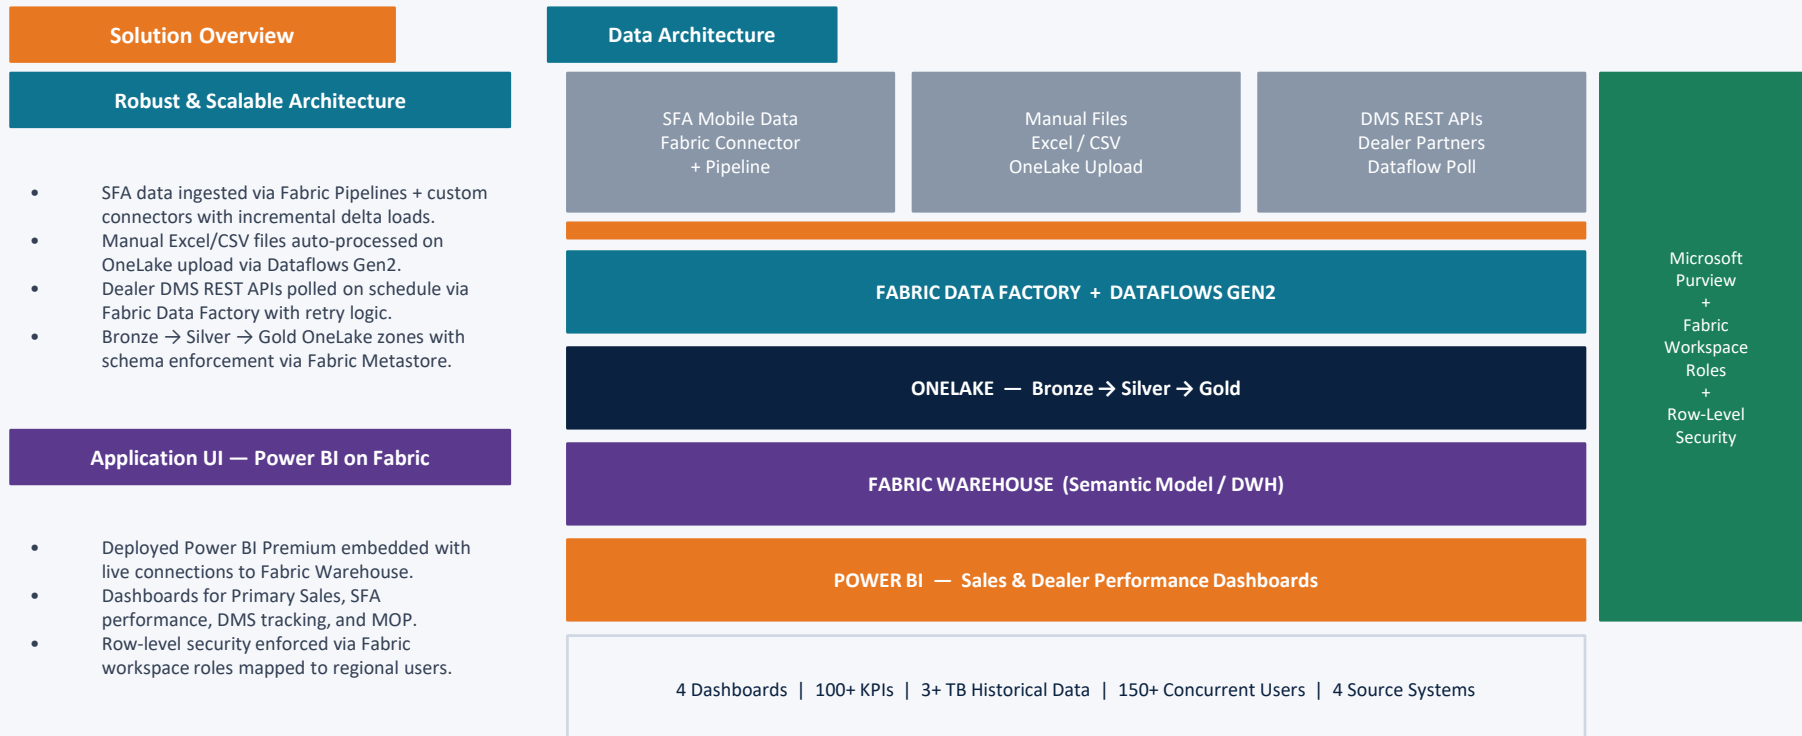

Challenge 3

DMS REST API data from dealer partners stranded in operational systems

Challenge 4

No unified SKU-level view of sell-in vs sell-out across channels & regions

Ganit built a multi-source Microsoft Fabric platform with automated ingestion from SFA, flat files & DMS APIs, served through Power BI for real-time sales analytics

Thank You

Ganit provides cutting edge solutions at the intersection of hypotheses-based analytics, ML-driven AI, and new-data insights from smart devices

We have delivered tangible benefits to leading brands in North America, Europe, MENA and APAC
